Etere Integrated with Microsoft Azure and Amazon Cloud

Posted by philsandberg On July 06, 2016 0 Comment

Etere has announced integration with cloud providers, Amazon Cloud and Microsoft Azure, to allow fast transfer of bulk data. Setting up directories within Etere servers includes the option to assign rights to one or more users, or to set up a virtual directory available to all users. Back up your data in the cloud servers without latency or change of quality in the files.

Etere's integration allows users to access the cloud storage directly, without the use of third party tools or drivers. Etere systems are designed to promote connectivity and collaboration across distributed work environments. With this new integration, users are able to build an agile, flexible and intelligent architecture within a safe and secure server in the cloud.

Key features include:

- Safe and secure environment with customisable file access rights.
- Reliable file transfer, content distribution, file sharing and offsite backup.
- High-speed transfer even with bulk data.
- MD5 verification on files to ensure no data corruption.
- Quick setup, does not require third party tools or drivers to access the object storage.
- Manage file revisions quickly.
- Files may be compressed to provide transfer rates higher than line speed.
- Multi-users access.
- Maintain the quality of the files.
- Transfer big data and send large files at full line speed regardless of file size.
